Designing Differently

Where do great designs come from ?

- Throughout recorded history there have
- been individuals that where great engineers, designers, project leaders, true visionaries.

Designing Differently

Widely credited with the invention of the telephone

Hydrofoil HD-4 in 1919 speed record of 114Km/hr. Record stood for several decades

Tetrahedral kites

Photo Phone

Quotes:

The devil is in the details

-Ludwig Mies van der Rohe

- The details are not the details. They
- make the design.

- Ray & Charles Eames

Designing Differently

Kelly Johnson famed aeronautical & system engineer. Credited with designing over 38 major aircraft in his lifetime including the P-38 , Kingfisher, most famously SR-71 Blackbird and U2 spy plane

His colleagues claimed he could see “air”

Designing Differently

Engineering History trivia

Designing Differently

Engineering History trivia ?

The first recorded patent for an industrial invention was granted

■ When

OR

to Whom

Designing Differently

Fillippo Brunelleschi 1377-1446

- Patent granted 1421
- Credit with rediscovery of linear perspective
- One of the founders of the renaissance

The Santa Maria del Fiore cathedral in Florence possesses the largest brick dome in the world,^{[2][3]} and is considered a masterpiece of European architecture.

Designing Differently

So if you are not one of the great designers of time how do you get a great design ?

Designing Differently

First a history lesson

7/21

- 1988 Committee for the Advancement of Competitive Manufacturing formed, Members included GM, Ford, Loctite, DEC, Navistar, Allied Signal
- 1989- 1991 DFA 5.0 released with PCB analysis, Sheet metal
 - DFM released, DFA 5.1 released supporting Macintosh and VMS, Die casting and Powder metal DFM software released.
- 1991 – 1994 Newer versions of DFA, Large parts DFA, and Design for the Environment, and additional DFM modules released

Designing Differently

The result was a methodology and modular software tool that is customizable, easy to use, and capable of being used during the entire Product Development process

Designing Differently

The application of the methodology and software tool can be applied:

- Bottoms up
- Top down
- Subassemblies
- Single Parts
- Labor
- Quality Prediction
- Cost Estimates
- Almost anything you can think of

Designing Differently

A couple of prerequisites:

STATE OF ART

- Vendor quote verification
- Estimate hard tooling

Typical Product Cost Breakdown

Source : The True Cost of Oversea Manufacturing June 2004 N. Dewhurst & D. Meeker

Define Levels of Cost Analysis

Level 1 - A first impression by knowledgeable engineers of what a part , assembly or system would cost based on prior experience. (parametric)

■ **Level 2** - An estimation based on prior experience with similar products, budgetary estimates, vendor quotes and expert opinion and experience. (analogy) ■

Level 3 - Detailed costing of every part accomplished by using material cost estimation data bases, and time/motion studies. A high degree of accuracy is achieved by comparisons to industry standards and vendor quotes. (analytical)

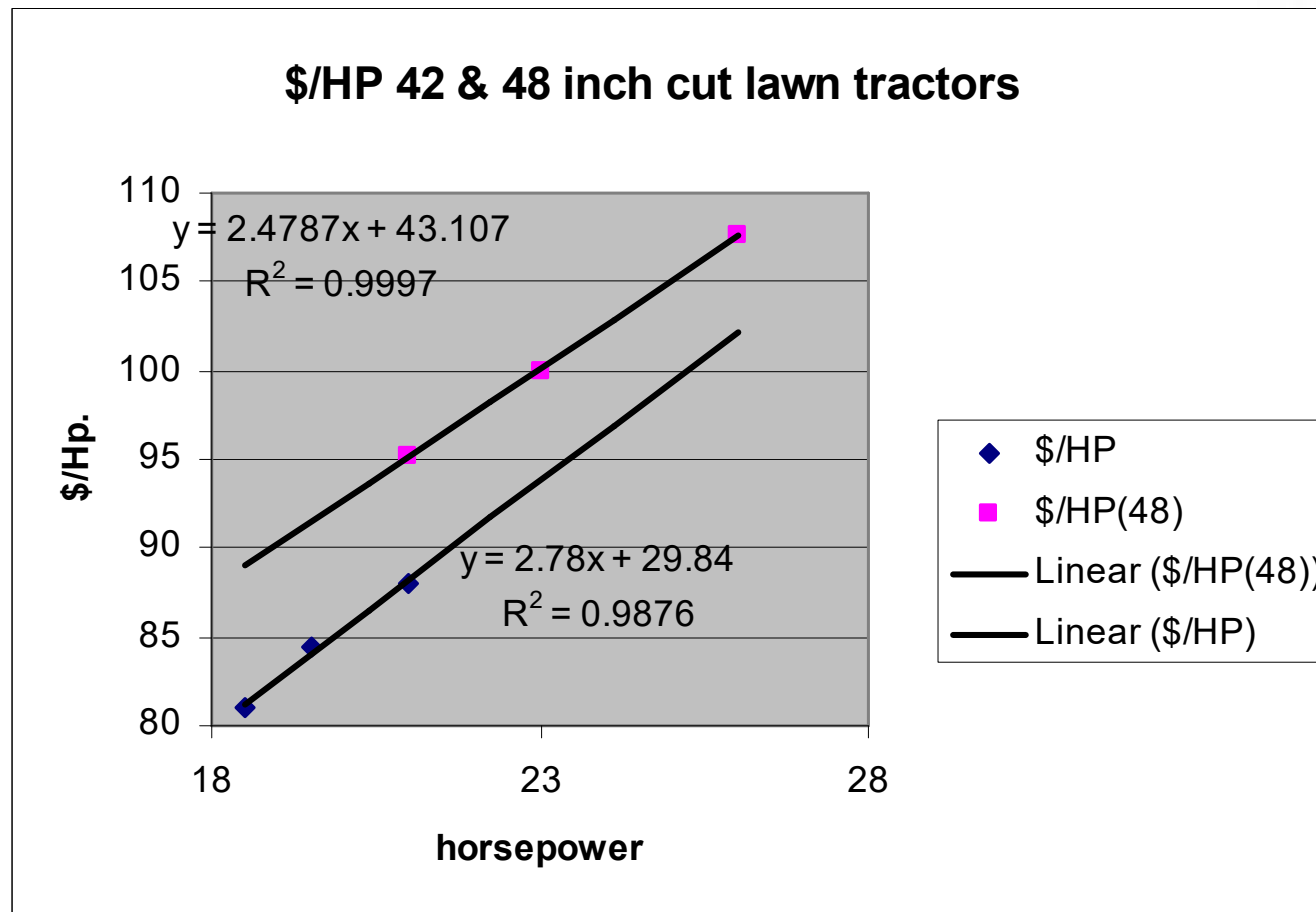

Trend Line Analysis

Tractor example

Trend Line Analysis

Tractor example

Trend Line Analysis

Next steps:

Break lawn tractor into major subassemblies

Project trend lines for each major subassembly

- Next level is to break down material content of
- each major subassembly, to incorporate material trends.

ABSTRACT

Higher powers in smaller packages has trended to the point where junction to case resistances are the majority of the overall allowable thermal resistance. This has pressured the sink to ambient resistances to the point where standard cooling solutions are no longer a viable option. Current trends are pushing chip fluxes into the range of 50 to 100 W/cm². At these fluxes it is critical to optimize the overall system resistance by studying the tradeoffs between spreading, interface, conduction, and airside resistances.

This paper discusses one case study and outlines the module and system level benefits of heat pipe heat sinks capable of handling high heat fluxes. At the module level the heat pipe uses two phase boiling heat transfer from the large specific surface area of a powder metal wick structure to remove the high heat fluxes generated at the die level. This minimizes conduction and spreading resistances. At the system level, heat pipes isothermalyze the entire fin area, allowing designers to make optimum use of fin volume and

flow areas to achieve minimum thermal resistances with lower velocity and lower pressure drops.

INTRODUCTION

Although this case study is specific to a single application, the problem solved is typical of current and future processor power levels and fluxes. The approach used to get from problem definition to end solution is applicable to a broad range of applications and the conclusions drawn should expedite solutions for similar applications. The solution selected in this case study a "tower" heat pipe heat sink, was dictated by the allowable fin geometry. The chip level and system level benefits are applicable to a family of heat pipe assisted heat sinks including vapor chambers and towers.

PROBLEM DEFINITION

Figure 1 and the data listed in the Table 1 sufficiently define the requirements and provide enough information to begin the process of evaluating alternative solutions

Don't have to Buy to Look

Cost Estimating Example

- Machining estimate
- Machining estimate with recommendations
- Alternative manufacturing methods

Machining issues

Highlighted areas represent holes that require side operations

Undercut Area

Undercut Area

Highlighted areas represent deep counterbores

Highlighted areas represent small fillets or chamfers

This area represents an undercut which sits underneath the first undercut as shown in the other highlighted area

Machining Estimate

Current:

Time = 12 - 15 hrs

Cost = \$ 780 - 975

With Recommendations:

Time = 7 - 10 hrs

Cost = \$ 455 - 650

Total Savings = \$ 325 / part

Alternative Methods Estimates (investment cast)

Investment Casting

DaTuM 3D
Designing The Future of Manufacturing

Re-designed for Investment Casting:

Investment Cast Part:

- Initial Tooling Investment of \$22,000 - \$25,000
- Cast parts will cost:
\$16.⁰⁰ - \$22.⁰⁰ / part
(in lots of 100)
- CNC Machine side features with 4th axis machine center
< 2 hours = \$110.⁰⁰

Total Part Cost:

< \$135.⁰⁰ each

Alternative Methods Estimates (Metal Injection Molded)

Metal Injection Molding

DaTuM **3D**
Technology For Manufacturing

Some Re-design Required:

Metal Injection Molded Part:

- Initial Tooling Investment of \$45,000 - \$50,000
- Molded parts will cost: \$45.00 - \$50.00 / part (in lots of 100)
- CNC Machine side features with 4th axis machine center < 2 hours = \$110.00

Total Part Cost:

< \$160.00 each

Product development

DFMA can be used throughout the entire Product Development Process

Delivery: (8) weeks ARO		Resin: LNP DB 1004 EMMR, BK115				
Tooling Description: Single cavity self-contained <i>pre-hardened steel mold</i> , tri-plate gating with (4) pin-point gates, pin ejection, flat parting line, and bead blast cavity finish.						
Notes:						
<ul style="list-style-type: none"> • The molding material is a suggestion by our contact at LNP Corporation, based upon the need for optimum flatness. (<i>20% glass bead filled polycarbonate</i>) • The flatness is difficult to predict. We are proposing a "tri-plate" gating design with (4) pin-point gates for help in improving flatness. A flatness specification of .010 cannot be guaranteed. We feel reasonably confident that we could mold between .012" and .020" flatness. • "Sink" marks may be evident because of the intersecting wall section ratios. Any "sink" mark would not be part of the measured flatness.

Quality Tool

Design for Assembly

Product Quality/Assembly Efficiency Correlation

Every one second of assembly penalty time causes an average of 100 DPM

Quality Assessment Conclusions

- **For many corporations part variability is no longer the quality issue; quality problems arise mainly in assembly**
- **Assembly quality problems seem to correlate strongly with assembly difficulties**
- **The key to quality improvement is to reduce both the number of assembly steps, and the average time per operation**
